Home-Based Grip Training With Continuous sEMG in Post-Stroke Patients

Fictional Author A, Fictional Author B (Synthetic Demo Institute), 2026

Abstract

We demonstrate that home-based grip rehabilitation with continuous sEMG feedback improved hand function in post-stroke patients. The data belong to Dataset A.

1. Introduction

Home training reduces clinic visits. Sensors can show patients how well they train.

2. Methodology

Post-stroke patients trained at home. A continuous sEMG sensor recorded each grip session in Dataset A.

3. Results

Hand function scores improved significantly in stroke patients after the grip rehabilitation protocol. Muscle activation increased significantly during grip tasks measured with continuous sEMG. Grip strength also improved in stroke patients.

4. Discussion and Limitations

Limitations include self-reported training time. The protocol was not tested in other patient groups.

5. Conclusion

Home-based grip training with continuous sEMG is feasible.
